

Section 1 – Summary Handout

Update ...

Software Update: As at Feb 23, 2023 I am using Sveltekit version 1.0 and adapter-netlify 1.0 and node version 18.12.1. This is what the final build of this application will be using before the course goes live.

Netlify: there are two issues with Netlify/Sveltekit still to be resolved, neither are show-stoppers.

1. Cant use \$lib in db_helper function called by Netlify functions. Not a big problem as can give this a full path instead of \$lib.
2. *ntl deploy* requires *npm run build* which creates a build folder. If that build folder exists and you run *ntl dev* the app displays a mess with css/nav/everything not working. You must first DELETE the folder and then *ntl dev* displays the app perfectly! A little inconvenience until a fix is found.
